

SUMMER CAR CARE SERVICE CHECKLIST

BATTERY, CHARGING SYSTEM, CABLES AND TERMINALS: Your battery and charging system will be tested by a trained technician, who will also clean any surface corrosion and verify that connections are secure. If the battery is over four years old, consider replacing it.

BRAKES/ UNDERCAR: Your brakes will be inspected by a trained technician who will verify they are in proper working condition and will recommend replacement if needed. Spring is a good time to check the entire brake system. Winter conditions and salt on roads can lead to corrosion and premature failure. Replacing worn or damaged brake parts can improve vehicle safety and help reduce wear on other related components.

TUNE UP: A technician will check the vehicle's mileage and manufacturer's recommended service intervals to see if service is needed. Ignoring tune-up service can snowball into more catastrophic and expensive repairs down the road.

WIPER BLADES & LIGHTS: The operation and condition of wiper blades and all headlights, taillights, emergency flashers, turn signals, brake lights and back-up lights will be checked for your safety. It is manufacturer's recommendation to change wiper blades at least every 6 months. Harsh weather can deteriorate wiper blades and cause cracking, streaking, or chattering blades.

FILTERS: A technician will check the vehicle's mileage and manufacturer's recommended service intervals and suggest if replacement is needed. It is important to have your air filter checked in the spring time, as the outside air becomes filled with pollen, dust and debris. A clogged air filter won't allow enough air to enter the engine; this, along with a dirty oil filter can spell trouble for your vehicle. It is best to replace your oil and all filters before spring travel plans.

FLUIDS: Your oil will be changed and fluids (washer, coolant, transmission, brake and power steering) will be checked to make sure they are at or above minimum safe levels.
